Your Name: $\qquad$

Names of people you worked with: $\qquad$

## Task:

1. Which door did you use to enter Estella today (north, south, or west)?
2. Which is easier to understand: shuffling the observations or bootstrapping the observations?
3. Consider the following two datasets. For each one, create 5 different bootstrap samples by rolling a die. For dataset A, calculate the sample mean for each bootstrap sample. For dataset B, calculate the sample proportion of happy for each bootstrap sample.

Data A: 4, 10, 8, 1, 2, 4
Data B: happy, happy, sad, happy, sad, happy

## Solution:

3. Data A: Five possible bootstrap samples are as given.

| $\#$ | resamples |  |  |  |  |  | mean |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $1:$ | 2 | 4 | 4 | 4 | 4 | 2 | 3.33 |
| $2:$ | 1 | 2 | 2 | 1 | 8 | 8 | 3.67 |
| $3:$ | 1 | 4 | 2 | 10 | 2 | 10 | 4.83 |
| $4:$ | 2 | 8 | 4 | 8 | 4 | 4 | 5.0 |
| $5:$ | 2 | 2 | 1 | 4 | 2 | 2 | 2.17 |

Data B: Five possible bootstrap samples are as given.

| $\# \#$ | resamples |  |  |  |  |  | proportion happy |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | happy | happy | happy | happy | happy | happy | 1.0 |
| 2 | sad | happy | sad | happy | sad | happy | 0.5 |
| 3 | sad | happy | happy | happy | happy | happy | 0.83 |
| 4 | happy | sad | sad | happy | happy | sad | 0.5 |
| 5 | happy | sad | sad | happy | happy | sad | 0.5 |
